

## Defining a goal and designing the script

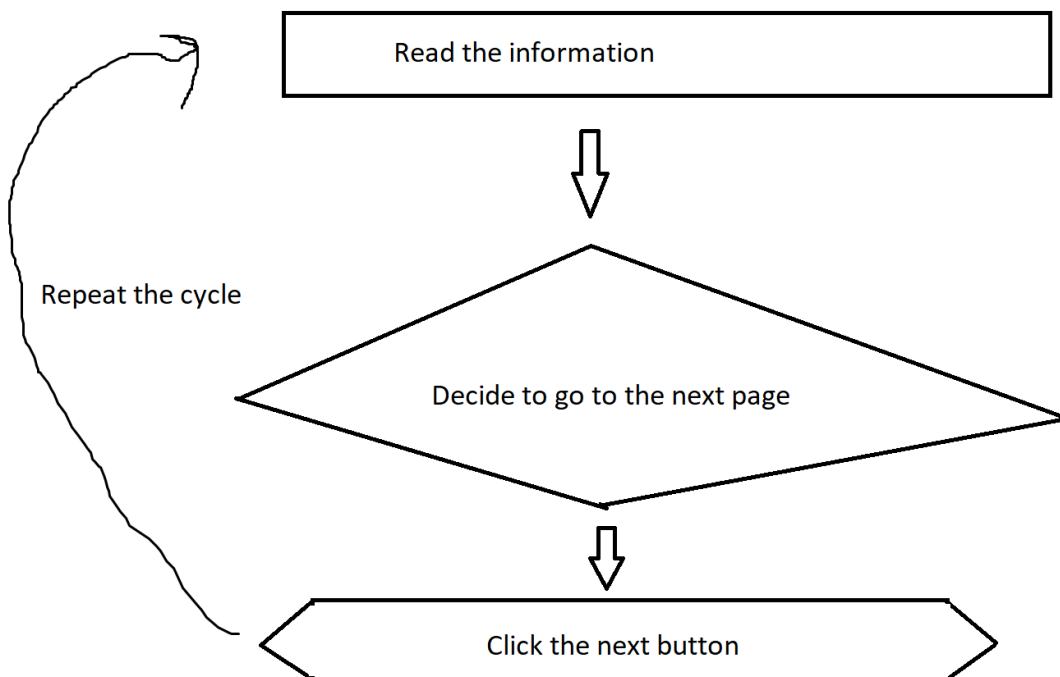

### Define the goal of your script

- a) The script's goal is to create a class with a constructor. This constructor is going to define properties that are going to be used in the div that we want to generate to the html website.

The goal is to create a script that will first put a div on the html site, get information from an array and have a button that cycle through the array of information when we click it on the website.

There is a part 2 of the assignment that we need to do. This part is using properties to show different kinds of information in the header section on the website.

- b) - Construct a class that holds objects  
- Construct a method that will be a html template  
- Construct an array that holds each person's information  
- Construct function that holds an if statement that cycles increments through the array  
- At the end we will do part 2 of the assignment and create objects that will be shown in the header section of the webpage

c)
